# Prime numbers

2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, ...,  $2^{82\,589\,933} - 1$ , ...

Euclid's theorem from 300 BC:

There are infinitely many prime numbers

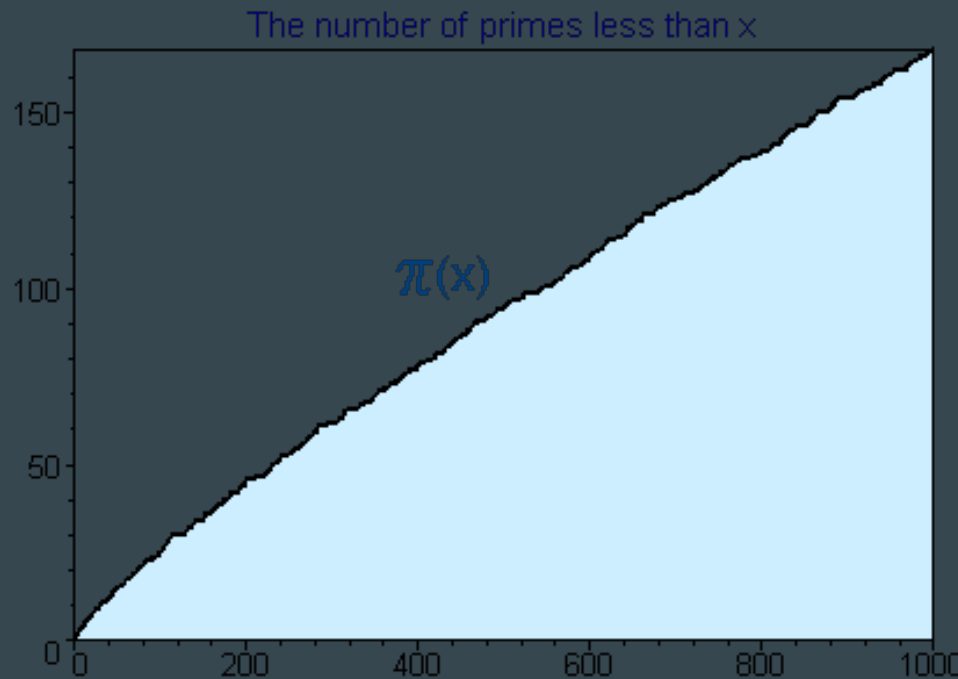

Number of primes smaller than  $n$ :

$$\Pi(n) \sim n / \ln(n)$$

$$\Pi(100\,000) = 9\,592$$

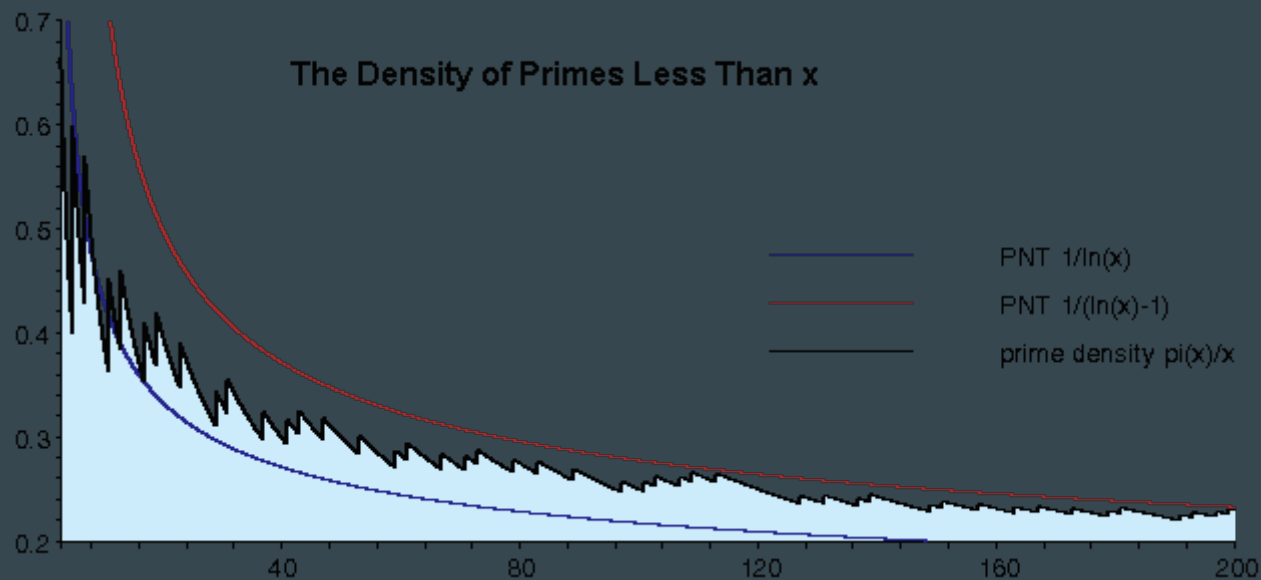

$$\Pi(1\,000\,000) = 78\,498$$

$$\Pi(10\,000\,000) = 664\,579$$

# Prime numbers

The chance of a random integer  $n$  being prime is about  $1/\ln(n)$

# Prime numbers

Palindromic primes: 2, 3, 5, 7, 11, 101, 131, 151, 181, 191, 313, 353, ...

The largest known as of March 2019 is (474,501 digits):  $10\,474\,500 + 999 \times 10\,237\,249 + 1$

Binary palindromic primes: 11, 101, 111, 10001, 11111, 1001001, 1101011, ...

Beastly palindromic primes: 700666007, 10000000000000066600000000000001

Triply palindromic primes:

10000500001 is prime with 11 digits. 11 is a palindromic prime with 2 digits. 2 is a palindromic prime.

$p = 1011310 + 4661664 \times 105652 + 1$ , which has  $q = 11311$  digits, and 11311 has  $r = 5$  digits.

Emirp: 13, 17, 31, 37, 71, 73, 79, 97, 107, 113, ..., 311, ..., 701, ...

# Patterns in primes

Twin primes:

(3, 5), (5, 7), (11, 13), (17, 19), (29, 31), (41, 43), (59, 61), (71, 73),  
(101, 103), ...

Common form:  $(6n - 1, 6n + 1)$

Unresolved: infinitely many, or is there a highest pair?

# Patterns in primes

Prime triplet  $(p, p+2, p+6)$ :  $(5, 7, 11), (7, 11, 13), \dots (347, 349, 353), \dots$

Prime quadruplet  $(p, p+2, p+6, p+8)$ :  $(5, 7, 11, 13), \dots (2081, 2083, 2087, 2089), \dots$

Sexy prime  $(p, p+6)$ :  $(5, 11), (7, 13), \dots$

Sexy prime triplets  $(p, p+6, p+12)$ :  $(7, 13, 19), (17, 23, 29), \dots$

Cousin prime  $(p, p+4)$ :  $(3, 7), (7, 11), \dots$

Isolated prime: neither  $p-2$  nor  $p+2$  is prime:  $2, 23, 37, 47, \dots$

# Patterns in primes

# Patterns in primes

Concatenate binary primes:

$$3 = 11, 17 = 10001$$

$$3+17 = 1000111 = 71$$

$$17+3 = 1110001 = 113$$

$$1049 = 10000011001$$

$$1051 = 10000011011$$

$$1051+1049 = 1000001100110000011011 = 2149403$$

# Ulam's Spiral

# Ulam's Spiral

Prime generating  
polynomials:

$$P = n^2 + n + 1$$

$$P = 4x^2 - 2x + 41$$

# Prime formulas

Euclid:  $E_n = p_n + 1$ , where  $p_n$  is the product of the first  $n$  prime numbers.

$$E_1 = 3, E_2 = 7, E_3 = 31, E_4 = 211, E_5 = 2311, E_6 = 30031 = 59 \cdot 509, \dots$$

Fermat:  $F_n = 2^{2^n} + 1$ ,  $n = 0, 1, 2, 3, \dots$

$$F_0 = 3, F_1 = 5, F_2 = 17, F_3 = 257, F_4 = 65537, F_5 = 4294967297 = 641 \cdot 6700417, \dots$$

Euler's prime generating formula:  $P_n = n^2 + n + 41$

$$P_n \text{ is prime for all } n = 0, 1, 2, 3, \dots, 39$$

Wilson:  $n$  is prime iff  $(n-1)! \bmod n = n-1$

$$n = 2, (2-1)! \bmod 2 = 2-1, \quad 1 \bmod 2 = 1$$

$$n = 3, (3-1)! \bmod 3 = 3-1, \quad 2 \bmod 3 = 2$$

$$n = 5, (5-1)! \bmod 5 = 5-1, \quad 24 \bmod 5 = 4$$

# Mersenne primes: $M_n = 2^n - 1$

$M_2 = 3, M_3 = 7, M_5 = 31, M_7 = 127,$

$M_{11} = 2047 = 23 \cdot 89, \dots$

L. Euler proved  $M_{31} = 2\,147\,483\,647$  in 1772

E. Lucas proved  $M_{127}$  in 1876

F. N. Cole proved  $M_{67} = 193\,707\,721 \cdot 761\,838\,257\,287$  in 1903

All  $n \leq 257$  has been tested by hand

The seven largest known primes are Mersenne primes.

As of June 2019, 51 Mersenne primes are known

Largest:  $2^{82\,589\,933} - 1$  with 24 862 048 digits.

# Computing primes

The chance of a random integer  $n$  being prime is about  $1/\ln(n)$ .

Computing a 1000 digit prime by choosing random numbers you expect to test about 2302 before finding a prime.

# Computing primes

## Sieve of Eratosthenes

1. Let  $p = 2$
2. Remove all multiples of  $p$
3. Let  $p =$  next integer
4. Iterate until  $p^2 > n$

Prime numbers

## Computing primes – primality tests

For random integers:

Probabilistic tests use  $O(n^2)$

Deterministic tests use  $O(n^6)$

For Mersenne numbers:

Lucas-Lehmer primality test

var  $s = 4$

var  $M = 2^p - 1$

repeat  $p - 2$  times:

$s = ((s \times s) - 2) \bmod M$

if  $s == 0$  return PRIME else return COMPOSITE

This is deterministic and use  $O(n^2)$
